

DAY 02 / 30

BASECAMP · FUNDAMENTALS

AI, ML, Deep Learning, GenAI: the family tree

AI, ML, Deep Learning, GenAI: the family tree

I used to use these four terms interchangeably. That was a mistake — they're nested inside each other, like Russian dolls.

- ◆ Artificial Intelligence (AI) is the broadest term: any system that mimics intelligent behavior.
- ◆ Machine Learning (ML) is a subset of AI: systems that improve at a task by learning from data, rather than being explicitly programmed.
- ◆ Deep Learning is a subset of ML: it uses layered neural networks (more on those in a few days) to learn especially complex patterns — the technique behind image recognition and speech-to-text.
- ◆ Generative AI is a subset of deep learning: models trained to produce new content — text, images, audio — rather than just classify or predict a number.

DAY 02 / 30

“Which of these four terms do you think gets misused the most in your industry?”

Follow along – Day 3 drops tomorrow.
